Project

Project Title:

Health Guardian => حارسك الصحي

Problem Definition:

In today's fast-paced world, people often forget important daily tasks, especially taking medications on time.

This issue can be critical for elderly individuals and patients who rely on strict medication schedules.

Recommended Solution:

Our project introduces a smart medication reminder system that acts as a personal health assistant. It reminds users at the right time using alerts such as:

- sounds
 - notifications
 - Emergency Email Alerts: Sends immediate notifications to family or caregivers if a dose is missed or medication runs out.
- ensuring that no dose is missed.

Objectives:

The system is designed to be simple, reliable, and easy to use for all age groups. It can be implemented as a mobile application or a small electronic device using basic hardware components.

★ The main goal of this project is to improve health, build consistent habits, and reduce risks caused by forgetting medications. By making reminders part of a daily routine, the system helps users stay organized, safe, and in control of their health.
